## Filter Components

---

These Component Objects provide High-Pass, Low-Pass, High-Shelf, Low-Shelf, and All-Pass filters. Filters may be connected between any components within the Layout, for applications which require 'roll-offs', simple tone controls, or even phase compensation.

Once a Component Object is placed into the Layout, all available settings can be accessed by double-clicking on the object. This produces a control dialog box, which displays the available component controls.
