SUSTAINABLE DEVELOPMENT

Sustainable business Practice in IMP Armature d.o.o.

IMP Armature is conscious of the importance of realising sustainable development and aims to do it by different means:

Taking care of environment

IMP Armature is using more different measures to take care of environment. One of them is following: At all workplaces, where exhausting substances are created, we use suction system with filters in order to release purified air into the environment.

Minimizing of waste and reuse of resources

In all of our process IMP Armature aims to create as little waste as possible and to reuse resources. We are doing this by more different measures.

Recycling

For waste from our operations which is not possible to reuse IMP Armature has contracts with more companies dealing with different waste material. From these materials they are extracting secondary raw materials or high energy fuels. IMP Armature takes care also about recycling of the everyday waste from employees.

Resource passport

The biggest part of the products of IMP Armature is considered to be recycled. Only elastomer seals are considered landfilled. By creating a resource passport IMP Armature gives information how certain parts of the products can be recycled.

Care for Health and Safety

In IMP Armature ensure our workers to have ergonomically designed workplaces. Our employees have periodic training on workplace safety according to the national requirements. To reach good results on this segment we are also using the PDCA cycle (plan-do-check-act), involvement of people in setting up the system and investigating incidents. Our company goal is to have good working conditions and satisfied employees. All this is also related to ISO9001 and LEAN production.
