Closed suction catheter
 Closed suction catheter set consists of a three-way valve, a control box assembly and a suction catheter.
 The suction catheter extends from the three-way valve to the control box and is covered in thin film. The three-way valve has distilled water delivery port for cleaning after use.
 When in use, the three-way valve connects to an endotracheal tube through patient port and a ventilator through the breathing port.
 Control box button activates suctioning and suction catheter can be inserted or retracted through the three-way valve into patients airway.
 The catheter is graduated for easy identification of depth of insertion.

1. Grip three-way Adaptor with one hand. Insert catheter down into Endotracheal tube with thumb and forefinger of another hand, and 10 seconds is preferred for each suction operation.
2. After insert catheter to the desired depth, depress the control valve simultaneously to apply suction.
3. After suction withdraw the catheter gently until the protective sleeve is straight.
4. Depress the control valve to flush the catheter by saline solution/distilled water through irrigation port for the next use.

INSTRUCTIONS FOR USE

- Verify that the package containing the electrodes or gel replacements is not damaged; in case of damages do not use the product. - Prepare the application area before use: it must always be clean, dry and free from hair. Lotions or oily skin will decrease the electrode adhesion. Avoid the use of solvents as these could cause skin irritation and reduce adherence of electrode. In case of using alcohol, make sure that this has completely dried up before applying the electrodes.
- Connect the electrodes to the electro-stimulator using adequate lead wires. Check that the leads and connections are not damaged, metal areas cannot be exposed.
- Carefully remove the electrode from protective liner by lifting a corner of electrode and slowly peel it away. Avoid touching the gel as much as possible. Do not peel the electrode by wire, pulling the wire might lead to damages in the connections.
- Stick the electrodes on the specified area: center first, then smooth down to electrode edges, press firmly. Electrodes must be placed following the instructions of the physician.
- Turn the stimulator on and adjust according to stimulator and physician's instructions for treatment. Refer to the user manual of the stimulator for further details.
- When the stimulation session is complete, turn the stimulator off and remove the electrodes.
- In case that the procedure is interrupted, check the functioning of the system again before restarting the session. Check that electrodes are conveniently adhered to the skin surface.
- Once treatment is completed, turn off the electrical stimulator.
- Lift at the edge of the electrode and carefully peel to remove electrode from the application area. A quick removal of the electrode could cause skin traumas. Do not remove electrodes by pulling the cable as damages might be produced in the product.

- Disconnect stimulator lead wires from the electrode connectors.
- Clean the electrodes after each use according to maintenance instructions. If electrodes begin to lose adhesion, replace with new electrodes
- Place the electrodes back on the protective liner and keep into the storage bag. Reseal tightly to prevent dry out.
- Disconnect the leads from the stimulation device.
