MANUFACTURER'S DECLARATION

Internal declaration regarding environmental performance
of composite product manufacturing

Out of concern for natural environment, in 2012 the Nowy Styl Group introduced a technology for manufacturing composite boards from post-production waste which has replaced the material intensive production technology based on particle boards.

Environmental performance of the implementation of composite board production technology in plants of the Nowy Styl Group results from the following:

- **reduced consumption of primary raw materials** by making use of wood and upholstery waste produced in manufacturing processes carried out at the Nowy Styl Group;
- **minimized amount of produced waste** by manufacturing a finished product without the need for additional mechanical treatment;
- **eliminated negative impact on environment from transportation** based on the withdrawal from purchased particle boards.
