To whom it may concern

The theoretical throughput for the VITROS 5600 Integrated System is up to 945 tests per hour.

As with all competitive systems, throughput measured in tests per hour is a theoretical estimate influenced by a number of factors, including a laboratory's sample/ test mix and sample arrival times. It means that the throughput is different for every customer.

To more accurately determine whether a system can handle your workload and meet required turnaround times (TAT) is to simulate the workload using the laboratories LIS and workflow data.

For and on behalf of OCD.
