System information

For **cobas c** 311/501 analyzers:

C3C-2: ACN 036

For **cobas c** 502 analyzer:

C3C-2: ACN 8036

Intended use

In vitro test for the quantitative determination of Complement C3c in human serum and plasma on Roche/Hitachi **cobas c** systems.

Summary[1,2,3,4]

Activation of the complement system takes place via a classical and an alternative route. The two pathways come together in a joint terminal path. As complement factor C3 is a factor common to both pathways, the concentration of C3 and its degradation products (including C3c) can be evaluated as a parameter for activation of the complement system.

Lowered values are indicative of activation. Additional differentiation can be made by determining C4. If the C4 level is normal, then activation of the alternative route is likely. Depressed values are observed in a number of inflammatory and infectious diseases. Primary causes are systemic lupus erythematosus (SLE), rheumatoid arthritis, subacute bacterial endocarditis, viremia, parasitic infections or bacterial sepsis. A considerable decrease in C3 can be found in patients with partial lipodystrophy or membranoproliferative glomerulonephritis when the C3-nephritis factor is present.

As an acute phase protein, C3 is produced to an increased extent during inflammatory processes. It is elevated in systemic infections, non-infectious chronic inflammatory conditions (primarily chronic polyarthritis) and physiological states (pregnancy). The elevation rarely exceeds twice the normal value and can mask a reduction in the current consumption.

A variety of methods, such as nephelometry, radial immunodiffusion and turbidimetry, are available for the determination of complement factor C3.

Test principle[2]

Immunoturbidimetric assay.

Human C3c forms a precipitate with a specific antiserum which is determined turbidimetrically.

Reagents - working solutions

R1 TRIS buffer: 100 mmol/L, pH 8.0; polyethylene glycol: 3.0 %; preservative

R2 Anti-human C3c antibody (goat): dependent on titer; TRIS buffer: 33 mmol/L; preservative

R1 is in position B and R2 is in position C.

Precautions and warnings

For in vitro diagnostic use.

Exercise the normal precautions required for handling all laboratory reagents.

Disposal of all waste material should be in accordance with local guidelines.

Safety data sheet available for professional user on request.

For USA: For prescription use only.

Reagent handling

Ready for use

Storage and stability

C3C-2

Shelf life at 2-8 °C:	See expiration date on **cobas c** pack label.
On-board in use and refrigerated on the analyzer:	6 weeks

Diluent NaCl 9 %

Shelf life at 2-8 °C:	See expiration date on **cobas c** pack label.
On-board in use and refrigerated on the analyzer:	12 weeks

Specimen collection and preparation

For specimen collection and preparation only use suitable tubes or collection containers.

Only the specimens listed below were tested and found acceptable.
Serum.
Plasma: Li-heparin plasma

The sample types listed were tested with a selection of sample collection tubes that were commercially available at the time of testing, i.e. not all available tubes of all manufacturers were tested. Sample collection systems from various manufacturers may contain differing materials which could affect the test results in some cases. When processing samples in primary tubes (sample collection systems), follow the instructions of the tube manufacturer.

Centrifuge samples containing precipitates before performing the assay.

Stability:[5]	4 days at 20-25 °C
	8 days at 4-8 °C
	8 days at -20 °C

The degree of fragmentation of C3 to C3c depends on the age and storage conditions of the sample. For fresh samples the values obtained are found to be up to 25 % lower than those obtained for aged samples depending on the extent to which fragmentation has occurred.[6]

C3C-2

Tina-quant Complement C3c ver.2

Materials provided

See "Reagents – working solutions" section for reagents.

Materials required (but not provided)

- See "Order information" section
- General laboratory equipment

Assay

For optimum performance of the assay follow the directions given in this document for the analyzer concerned. Refer to the appropriate operator's manual for analyzer-specific assay instructions.

The performance of applications not validated by Roche is not warranted and must be defined by the user.

Application for serum and plasma

cobas c 311 test definition

Assay type	2-Point End
Reaction time / Assay points	10 / 6-24
Wavelength (sub/main)	700/340 nm
Reaction direction	Increase
Units	g/L (mg/dL)
Reagent pipetting	Diluent (H_2O)
R1	90 µL	–
R2	17 µL	20 µL

Sample volumes	Sample	Sample dilution	
		Sample	Diluent (NaCl)
Normal	10 µL	9 µL	180 µL
Decreased	10 µL	4 µL	164 µL
Increased	10 µL	9 µL	180 µL

cobas c 501 test definition

Assay type	2-Point End
Reaction time / Assay points	10 / 10-46
Wavelength (sub/main)	700/340 nm
Reaction direction	Increase
Units	g/L (mg/dL)
Reagent pipetting	Diluent (H_2O)
R1	90 µL	–
R2	17 µL	20 µL

Sample volumes	Sample	Sample dilution	
		Sample	Diluent (NaCl)
Normal	10 µL	9 µL	180 µL
Decreased	10 µL	4 µL	164 µL
Increased	10 µL	9 µL	180 µL

cobas c 502 test definition

Assay type	2-Point End
Reaction time / Assay points	10 / 10-46
Wavelength (sub/main)	700/340 nm
Reaction direction	Increase
Units	g/L (mg/dL)
Reagent pipetting	Diluent (H_2O)
R1	90 µL	–
R2	17 µL	20 µL

Sample volumes	Sample	Sample dilution

	Sample	Diluent (NaCl)
Normal	10 µL	9 µL	180 µL
Decreased	10 µL	4 µL	164 µL
Increased	10 µL	18 µL	180 µL

Calibration

Calibrators	S1: H_2O
	S2: C.f.a.s. Proteins

Multiply the lot-specific C.f.a.s. Proteins calibrator value by the factors below to determine the standard concentrations for the 6-point calibration curve:

S2: 0.105	S5: 1.05
S3: 0.210	S6: 2.10
S4: 0.420	

Calibration mode	RCM2
Calibration frequency	Full calibration
	• after reagent lot change
	• as required following quality control procedures

Traceability: This method has been standardized against the reference preparation of the IRMM (Institute for Reference Materials and Measurements) BCR470/CRM470 (RPPHS - Reference Preparation for Proteins in Human Serum).[7]

Quality control

For quality control, use control materials as listed in the "Order information" section.

In addition, other suitable control material can be used.

The control intervals and limits should be adapted to each laboratory's individual requirements. Values obtained should fall within the defined limits. Each laboratory should establish corrective measures to be taken if values fall outside the defined limits.

Follow the applicable government regulations and local guidelines for quality control.

Calculation

Roche/Hitachi **cobas c** systems automatically calculate the analyte concentration of each sample.

Conversion factors:	g/L x 100 = mg/dL
	mg/dL x 0.01 = g/L

Limitations - interference

Criterion: Recovery within ± 10 % of initial values at C3c levels of 0.9 g/L.

Icterus:[8] No significant interference up to an I index of 60 for conjugated and unconjugated bilirubin (approximate conjugated and unconjugated bilirubin concentration: 1026 µmol/L or 60 mg/dL).

Hemolysis:[8] No significant interference up to an H index of 1000 (approximate hemoglobin concentration: 621 µmol/L or 1000 mg/dL).

Lipemia (Intralipid):[8] No significant interference up to an L index of 2000. There is poor correlation between the L index (corresponds to turbidity) and triglycerides concentration.

Rheumatoid factors up to 1200 IU/mL do not interfere.

High dose hook-effect: No false result occurs up to a C3c concentration of 12.5 g/L.

Drugs: No interference was found at therapeutic concentrations using common drug panels.[9,10]

In very rare cases, gammopathy, in particular type IgM (Waldenström's macroglobulinemia), may cause unreliable results.[11]

For diagnostic purposes, the results should always be assessed in conjunction with the patient's medical history, clinical examination and other findings.

C3C-2

Tina-quant Complement C3c ver.2

cobas®

ACTION REQUIRED

Special Wash Programming: The use of special wash steps is mandatory when certain test combinations are run together on Roche/Hitachi **cobas c** systems. The latest version of the carry-over evasion list can be found with the NaOHD-SMS-SmpCln1+2-SCCS Method Sheets. For further instructions refer to the operator's manual. **cobas c** 502 analyzer: All special wash programming necessary for avoiding carry-over is available via the **cobas** link, manual input is not required.

Where required, special wash/carry-over evasion programming must be implemented prior to reporting results with this test.

Limits and ranges
Measuring range

0.04-5.0 g/L (4-500 mg/dL)

Determine samples having higher concentrations via the rerun function. Dilution of samples via the rerun function is a 1:2 dilution. Results from samples diluted using the rerun function are automatically multiplied by a factor of 2.

Lower limits of measurement
Lower detection limit of the test

0.04 g/L (4 mg/dL)

The lower detection limit represents the lowest measurable analyte level that can be distinguished from zero. It is calculated as the value lying 3 standard deviations above that of the lowest standard (standard 1 + 3 SD, repeatability, n = 21).

Expected values[12]

0.9-1.8 g/L (90-180 mg/dL)

Each laboratory should investigate the transferability of the expected values to its own patient population and if necessary determine its own reference ranges.

Specific performance data

Representative performance data on the analyzers are given below. Results obtained in individual laboratories may differ.

Precision

Precision was determined using human samples and controls in an internal protocol with repeatability (n = 21) and intermediate precision (3 aliquots per run, 1 run per day, 21 days). The following results were obtained:

Repeatability	Mean	SD	CV
	g/L (mg/dL)	g/L (mg/dL)	%
Precinorm Protein	1.17 (117)	0.01 (1)	0.9
Precipath Protein	2.05 (205)	0.02 (2)	0.9
Human serum 1	1.40 (140)	0.01 (1)	0.8
Human serum 2	1.85 (185)	0.02 (2)	1.2

Intermediate precision	Mean	SD	CV
	g/L (mg/dL)	g/L (mg/dL)	%
Precinorm Protein	1.14 (114)	0.02 (2)	1.4
Precipath Protein	2.02 (202)	0.04 (4)	1.8
Human serum 3	1.43 (143)	0.02 (2)	1.3
Human serum 4	2.09 (209)	0.04 (4)	2.0

Method comparison

C3c values for human serum and plasma samples obtained on a Roche/Hitachi **cobas c** 501 analyzer (y) were compared with those determined using the same reagent on a Roche/Hitachi 917 analyzer (x).

Sample size (n) = 266

Passing/Bablok[13]	Linear regression
y = 0.981x + 0.034 g/L	y = 0.963x + 0.056 g/L
τ = 0.913	r = 0.989

The sample concentrations were between 0.530 and 3.00 g/L (53.0 and 300 mg/dL).
