

Vasofix® Safety

Shielded I.V. Catheter with injection port

Protects you and your healthcare team against
needlestick injuries and related infections.

Self-activating needlestick protection ...

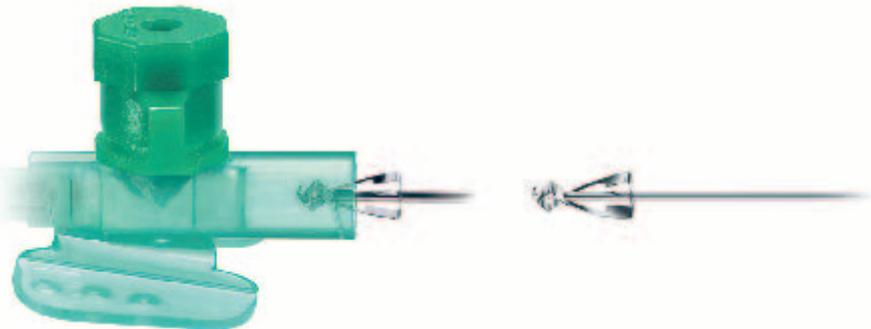

Now, everything's alright.

"The waiting was agonizing ..."

Everybody's heard the chilling accounts of how healthcare staff have contracted potentially fatal diseases. The quicker you have to act, the more likely needlestick injuries can occur. The ambulance drives over a bump or the patient startles, causing a blood-filled needle to dislodge and puncture somebody. Then comes the distress of waiting and not knowing whether the test will be positive for infections like hepatitis A, B or C or HIV.

For many years, the call for better needle protection systems has been loud. We at B. Braun have answered the call by introducing Vasofix® Safety, the shielded I.V. catheter with injection port. A specially engineered clip selfactivates to disarm the sharp needle's tip the instant it is withdrawn from the vein. Vasofix® Safety reduces the risk of needlestick injuries at a time when blood-borne viruses are the most active.

Now, there finally is a safer design for preventing needlestick injuries and accidental transmission of infection.

... well-established handling properties

Vascular Access

Handling as usual

With the new Vasofix® Safety, you use the same familiar puncture technique as with conventional Vasofix® I.V. catheter.

No changes in handling. That means a no staff re-training and minimum impact on clinical practice. This aspect benefits overstretched budgets, too, and makes purchasing decisions easier.

Safety features

- Self-activating clip technology
No user activation required
- Eliminates risk of inadvertent activation
- Safety mechanism cannot be bypassed
- Safety clip covers needle tip immediately after use
- Same puncture technique as with conventional I.V. catheters
- Hygienic injection of medication without an extra needle or risk of needlestick injury

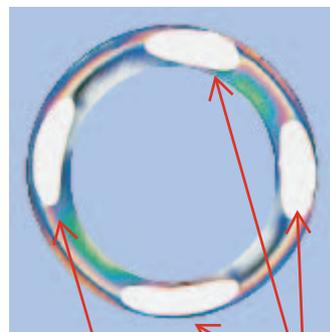

Puncture characteristics

The electropolished, sharp backcut bevel and conically tapered atraumatic catheter tip requires low puncture force and causes almost no pain to the patient.

Double flashback

The highly transparent grip part with hydrophobic, liquid-tight blood stopper and transparent catheter segments allow reliable confirmation of catheter positioning when slightly withdrawing the needle.

Radiodetectable catheter

Four fully embedded x-ray contrast lines in the transparent catheter support the detection after an inadvertent catheter cut or embolization of a catheter fragment. Minimizes complications for patient and liability for the hospital.

4-ios rentgeno
