SUBJECT: QUALITY OF NEW CABLE TIES

BM is constantly working to improve the quality of its products and the new cable ties have a higher quality than the previous ones.

The European normative applicable to the cable ties is EN 62275 (Cable management systems – Cable ties for electrical installations) and everyone can easily buy it on the web in order to consult it. This normative provides all the security requirements of the cable ties. This normative does not focus on the weight or size of the cable ties, but rather on the level of performance of the cable ties. It seems to me a good approach, because for example it is not said that a car is safer than another one because it is bigger and heavier: the safety level depends on how it was designed. Returning to the problem of the cable ties, a fundamental parameter to evaluate the cable ties is the resistance to the traction and the new cable ties have the same resistance values to the traction test as the previous ones. But unlike the previous ones, the new ones are also certified for external use, so they are more resistant because they resist to UV rays. I remember that the quality level of our cable ties is certified by an independent third party recognized in all the world: UL.

Obviously, the quality of our cable ties is guaranteed by BM if they are installed with the tools designed by BM specifically for them, that is to say the automatic cable ties tools 1100 and 1101 for nylon cable ties, and 1105 for stainless steel cable ties.

Please don't hesitate to contact me for any other clarification concerning our products.
